ENGRID: Open-Source Mesh Generation

OpenFOAM “Stammtisch”

Thursday, November 5, 2009

University of Stuttgart, Campus Vaihingen

Allmandring 30, 70569 Stuttgart

Overview

- Where are we now
 - Brief introduction
 - Demonstration
 - Examples
- Future
 - What is planned?
 - What is envisaged?

Motivation for Open-Source Meshing

- *enGits* started in October 2006
 - Main activity: software development for very specific CFD problems
 - To extend business a reliable CFD solution was desired
 - Commercial codes too expensive
(no guaranteed business coming in)
 - Open-source, as well as in-house, solver and post-processing available
 - Meshing situation not sufficient for commercial CFD work
- Expertise and a few ideas on how to improve unstructured mesh generation
 - Write own meshing software ...

Motivation for Open-Source Meshing

- Open-source or proprietary software?
- Decision was made rather quickly in favour of OSS
- As a small company it would be extremely difficult to compete with the commercial codes
- Funding available for an open-source development
(funded by the European Space Agency)
- *Possibility to generate business with support and customisation of the software*

open-source „process chain“

- **geometry modelling**
 - Blender
 - Salome
- **geometry import and surface meshing**
 - Gmsh
 - NETGEN
- **isentropic volume meshing (tetras)**
 - NETGEN
 - Tetgen → ATTENTION: not allowed for commercial applications, NOT OPEN-SOURCE
- **an-isotropic boundary layer grids**
 - ... → Engrid
- **solver**
 - OpenFOAM
 - Code Saturne
 - Elmer
- **visualisation**
 - ParaView
 - Open Data Explorer

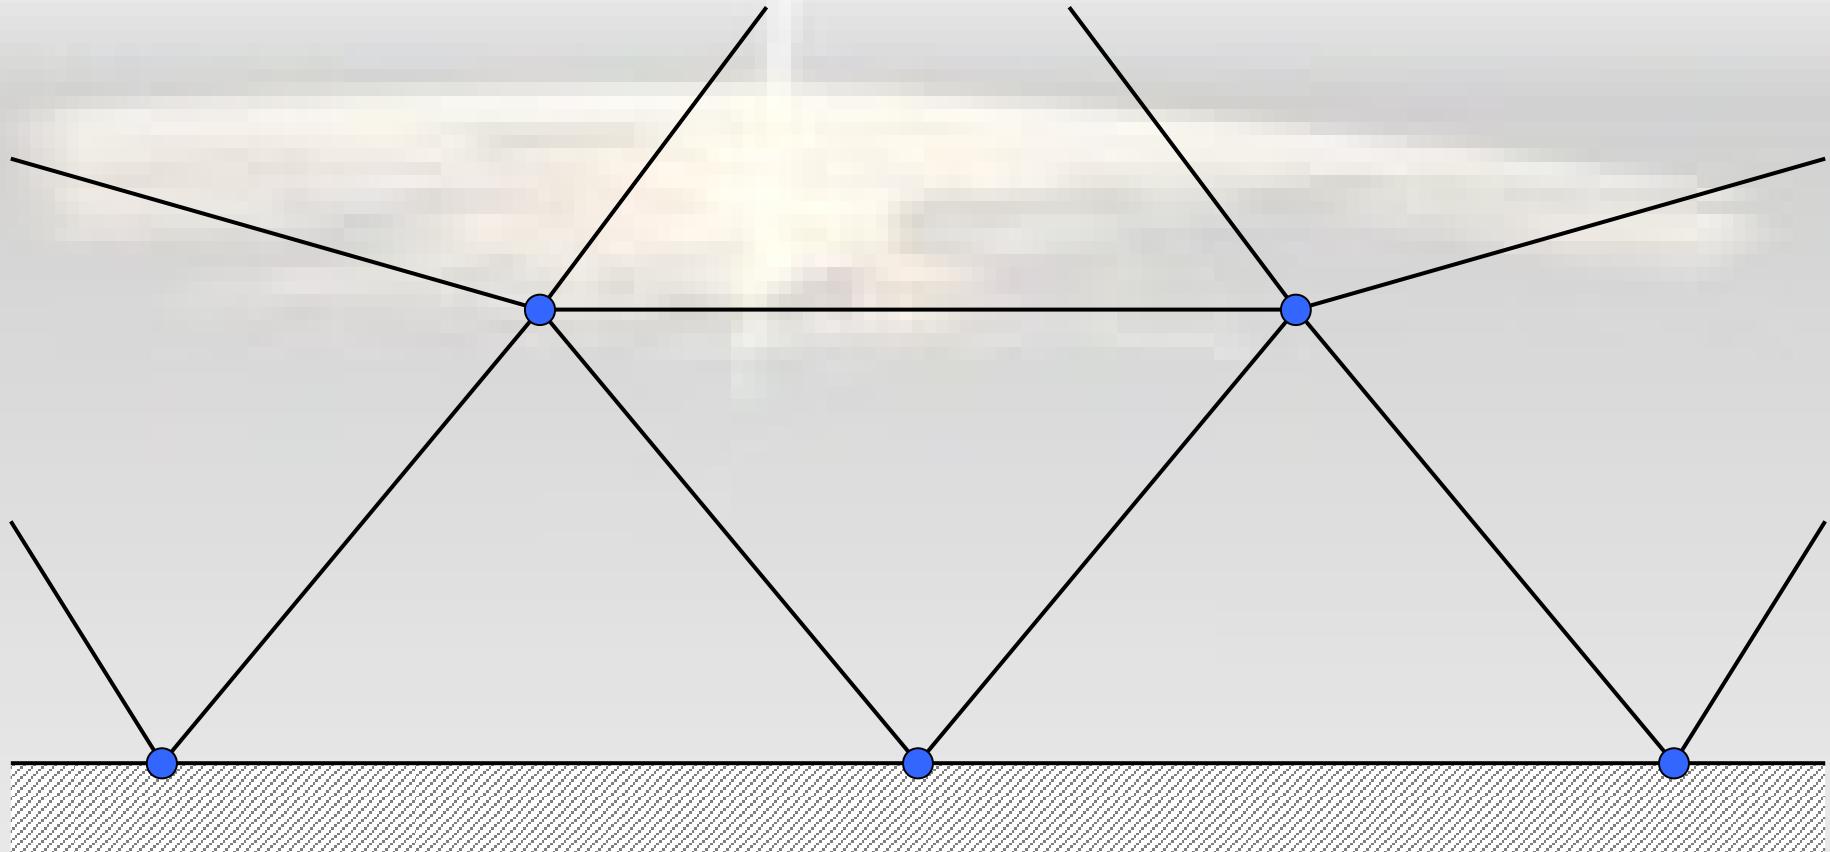

Current Status of ENGRID

- Capable to create unstructured hybrid grids for CFD (prisms & tetras)
- Reliable support for prismatic boundary layers
- Requires a triangulated surface as input
 - STL files like for snappyHexMesh
 - NETGEN could be used as IGES/STEP → STL converter
- Exports OpenFOAM cases (native format)
- Experimental support for polyhedral grids
 - direct export to OpenFOAM
- Basic modification tools (e.g. extrusion, rotation)

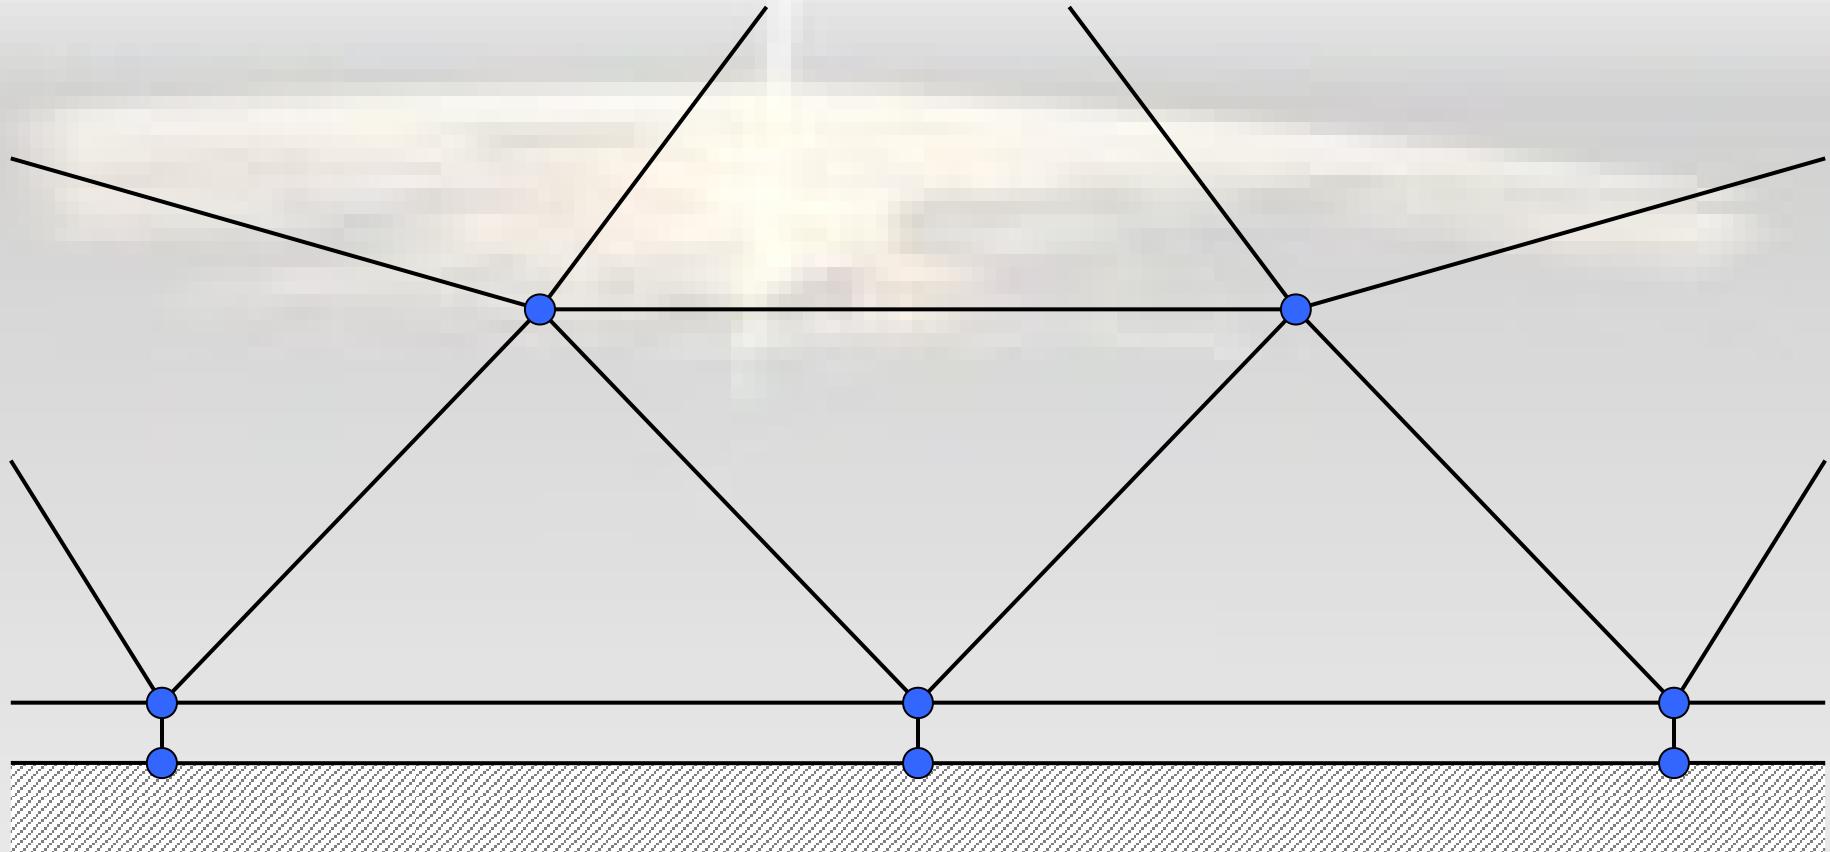

Brief Technical Background

- ENGRID uses NETGEN to create tetrahedral grids from surface triangulations
- Prismatic layers are “seeded” and “grown” into an existing and healthy grid
- No overlapping in sharp corners
- Polyhedral support keeps the boundary layer as it is and “dualises” the tetrahedral part of the mesh

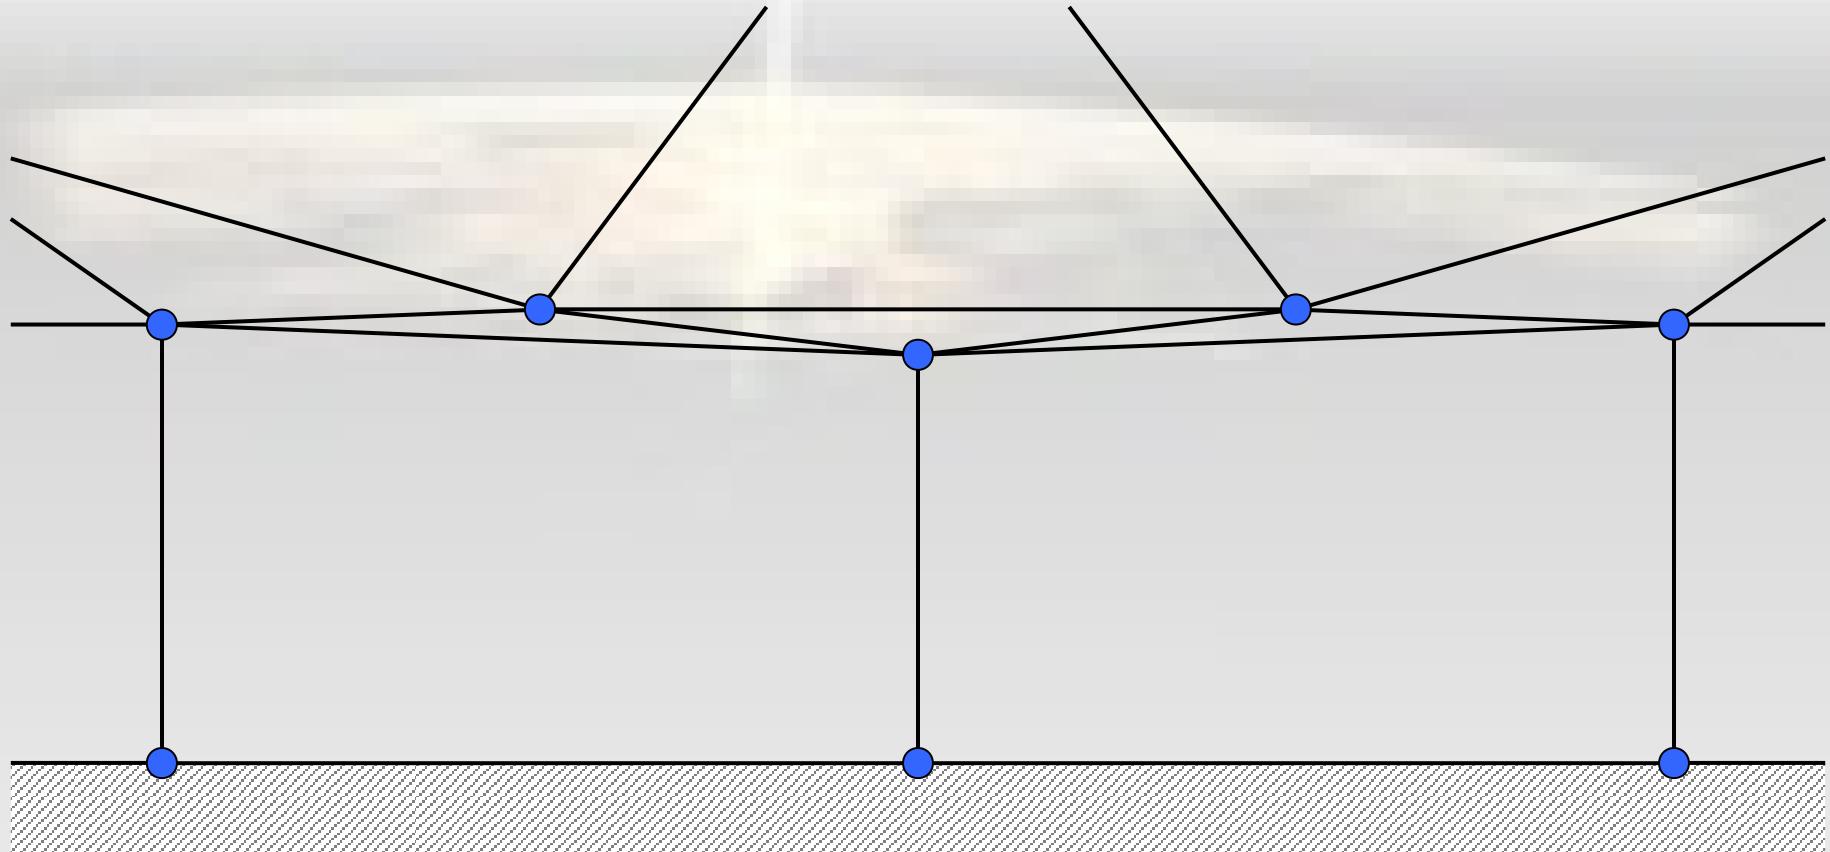

Creating Prismatic Layers

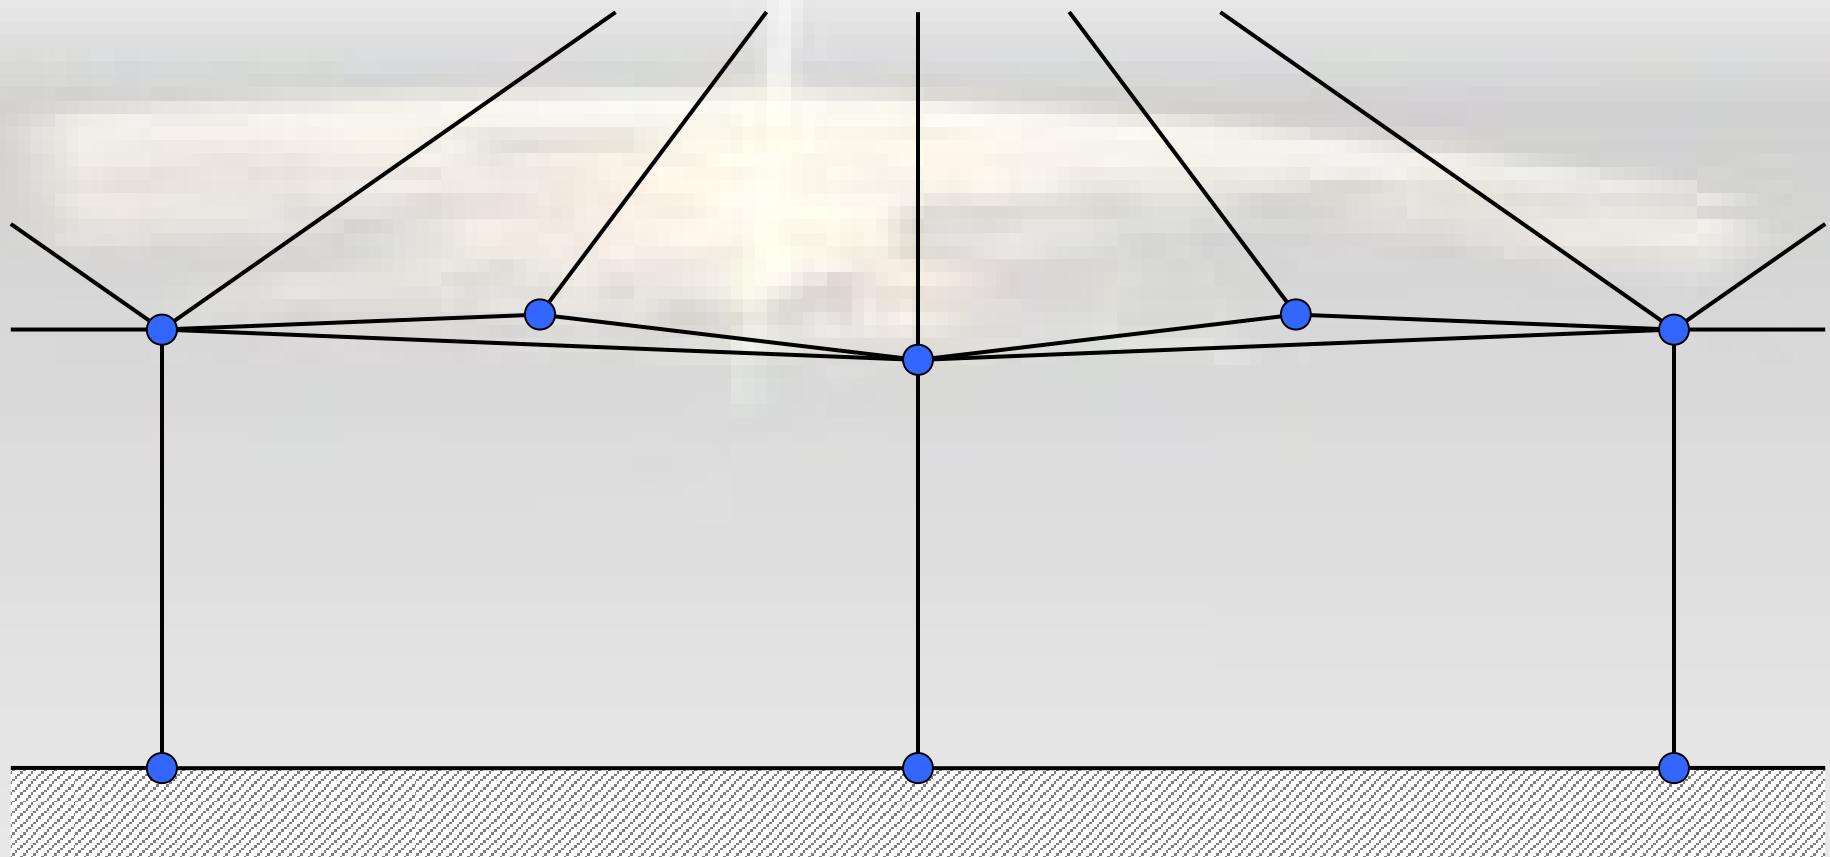

Creating Prismatic Layers

Demonstration

- Engrid is not perfect
 - between 1.5 and 2 'man years' development
- We are happy about feedback
- We are happy about suggestions
- We would be even more happy about help ;-)

Planned Developments

- Interpolated surfaces
- Anisotropic (prisms) refinement of free shear layers
 - feasibility/demonstration for customer
 - first step towards adaptive meshing
- Better control of mesh density
 - better user interface
 - point, line, ..., sources
- Interface to more OpenFOAM solvers

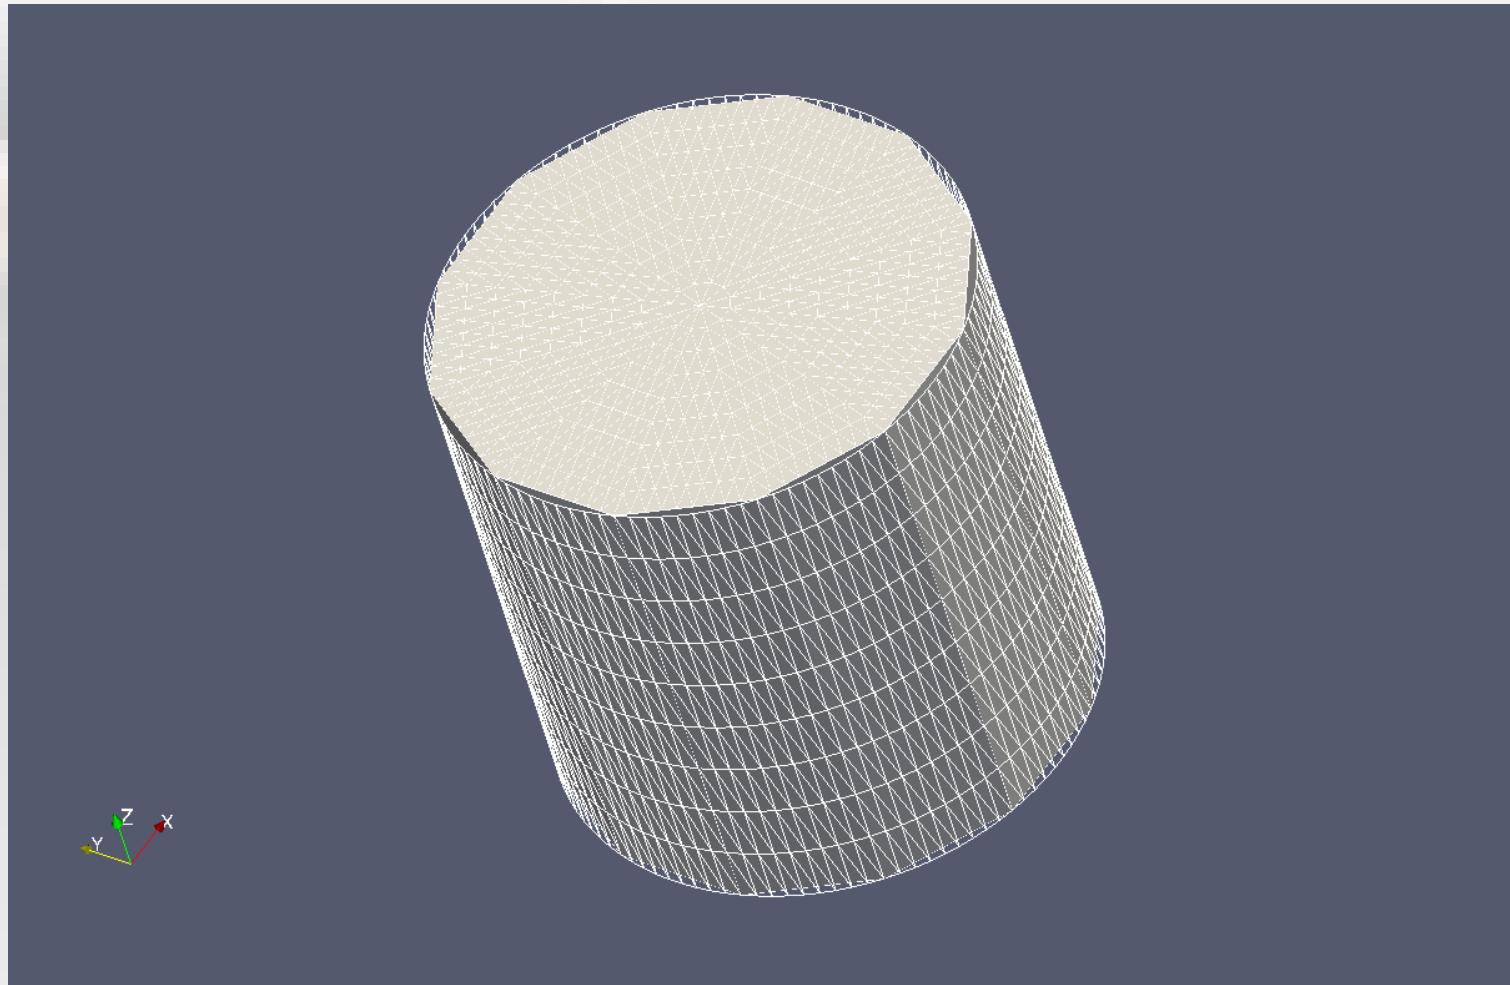

Interpolated Surfaces

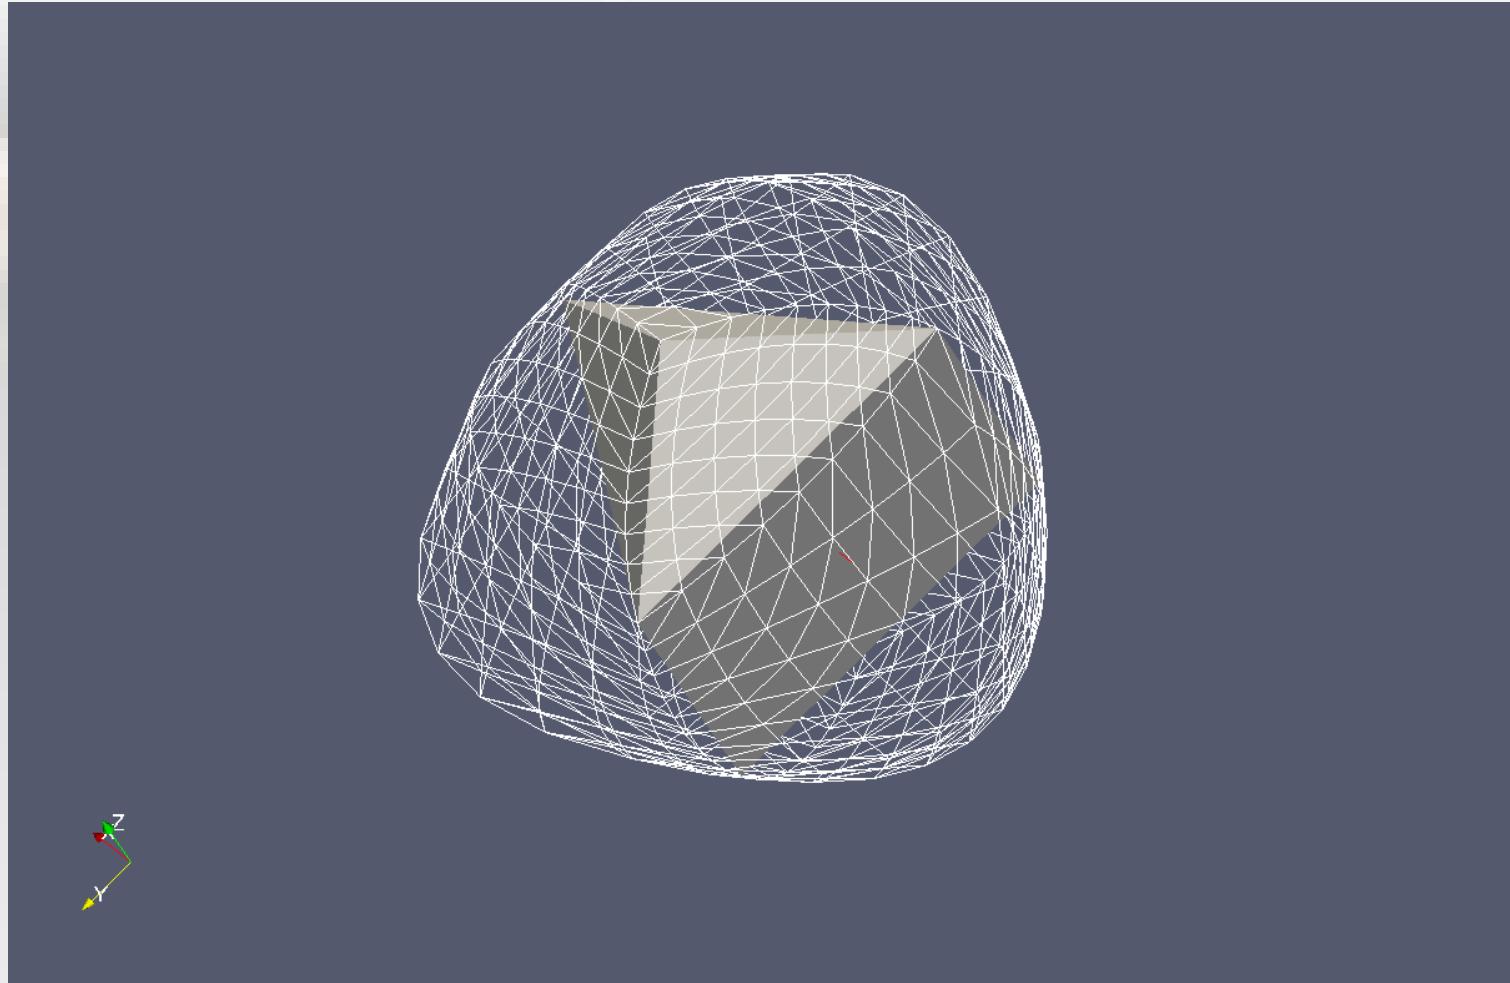

Interpolated Surfaces

Refinement of Free Shear Layers

Size in y-direction exaggerated

Refinement of Free Shear Layers (*supersonic base-flow*)

Envisaged Developments

- Adaptive meshing
 - y^+
 - shear layers
 - shocks
 - ...
- Better support for polyhedral grids
- Hex far fields
 - maybe coupled with snappyHexMesh

Thank you for your attention
